Meaning of list[-1] in Python

I have a piece of code here that is supposed to return the least common element in a list of elements, ordered by commonality:

```
def getSingle(arr): from collections import Counter c = Counter
```

How to list all installed packages and their versions in Python?

Is there a way in Python to list all installed packages and their versions? I know I can go inside `python/Lib/site-packages` and see what files and directories exist, but I find this very awkward.

python

can we have list comprehension without a for loop and just if/else to put a single default value inside the list and later extend it if required? i.e. `result = ['hello' if x == 1]`.

Difference between List, List>, List, List, and List

The notation List> means "a list of something (but I'm not saying what)". Since the code in test works for any kind of object in the list, this works as a formal method parameter. Using a type parameter

[What is the difference between list and list \[:\] in python?](#)

When reading, list is a reference to the original list, and list[:] shallow-copies the list. When assigning, list (re)binds the name and list[:] slice-assigns, replacing what was previously in the list.

Publicly Traded Solar Energy Stocks - Full List , InvestSnips

Complete list of publicly traded solar companies on U.S. exchanges. Covers solar panel manufacturers, installers, inverter makers, and solar energy developers.

python

How can I check if a list has any duplicates and return a new list without duplicates?

[What is the difference between list and list \[1:\] in Python?](#)

By using a : colon in the list index, you are asking for a slice, which is always another list. In Python you can assign values to both an individual item in a list, and to a slice of the list.

Python: list of lists

The first, [:], is creating a slice (normally often used for getting just part of a list), which happens to contain the entire list, and thus is effectively a copy of the list. The second, list(), is using the actual

[How to concatenate \(join\) items in a list to a single string](#)

For handling a few strings in separate variables, see [How do I append one string to another in Python?](#). For the opposite process - creating a list from a string - see [How do I split a](#)
